

Messi and paolini ultraflex 13

£6.48

DESCRIPTION

This Messi & Paoloni New Model has been specifically designed for high power amplifiers, and high frequency Moon bouncing lovers.1) Extreme Flexibility: perfect matching with rotator-operated antennas, obtained by means of a sophisticated full copper-stranded inner conductor (19 wires instead of 7).2) New improved dielectric: amazing attenuations up to 10 GHz, ideal for "MOON BOUNCING" lovers. Notwithstanding its size is only 12.7 mm (effective 0.50"), this prestigious cable rivals larger models size 14.6 mm or stiff 15 mm corrugated copper cables, reducing the number of connectors needed from 4 to 2 (because no further flexible cable is needed for the final connection to the antenna).3) Sturdiness and Screening Efficiency at its top: >105 dB (SA), and improved sturdiness reached by adding 24 more wires to the braid, for a total of 168 wires (70% coverage + 100% foil). This leads to a dramatic reduction of the background noise (moreover the braiders used are 24 spools, instead of 16 spools, giving 50% MORE CROSSOVERS).4) Reduced weight and bulk compared to its direct competitors (for a reduced stress of the "hanging and swinging" stretch of the cable in rotor-operated antennas). The high power handling and incredible performances compared to some bulkier, heavier and more expensive cables of the competition make it a must for ambitious installations (especially EME applications and rotator-operated antennas).5) Professional UHF (PL) and "N" connectors are available along with video assembly instructions.
